

Package ‘japanmesh’

December 2, 2021

Type Package

Title Functions for the Japanese Regional Mesh Codes ('JIS X 0410')

Version 0.1.1

Description Functions for the Japanese regional mesh codes defined in 'JIS X 0410'

(<https://www.jisc.go.jp/app/jis/general/GnrJISNumberNameSearchList?show&jisStdNo=X0410>).

Conversion between regional mesh codes and longitude/latitude, and between mesh codes of different scales.

<i>bbox_to_mesh</i>	<i>Converting bbox to regional meshes</i>
---------------------	---

Description

Converting bbox to regional meshes

Usage

```
bbox_to_mesh(bbox, size)
```

Arguments

<i>bbox</i>	A bbox or a list of bbox.
<i>size</i>	A mesh size.

Value

A mesh vector (when bbox is a bbox) or A list of mesh vectors (when bbox is a list of bbox).

geometry_to_mesh

Converting geometries to regional meshes

Description

Converting geometries to regional meshes

Usage

```
geometry_to_mesh(geometry, size, .predicate = sf::st_intersects)
```

Arguments

geometry	A sfc vector.
size	A mesh size.
.predicate	A .predicate parameter for sf::st_filter function.

Value

A list of mesh class vectors.

japanmesh

Functions for the Japanese Regional Mesh Codes (JIS X 0410)

Description

japanmesh is an R package for using the reference regional mesh (the 1st mesh to the 3rd mesh), the split regional mesh as defined by the JIS (Japan Industrial Standard) X 0410 'regional mesh code' and 1/10 subdivision of the 3rd mesh. Regional mesh codes are square-like regional divisions set up for all regions of Japan based on longitude and latitude.

`mesh_city2015` *List of mesh codes by municipality in 2015*

Description

List of mesh codes by municipality in 2015

Usage

```
mesh_city2015
```

Format

An object of class `tbl_df` (inherits from `tbl`, `data.frame`) with 461373 rows and 4 columns.

Source

http://www.stat.go.jp/data/mesh/m_itiran.html

`mesh_class` *Regional mesh vector*

Description

A series of functions return `mesh` class for each mesh size. `mesh_auto` returns automatically determine mesh size by the largest mesh size.

Usage

```
mesh_80km(x, strict = TRUE)
mesh_10km(x, strict = TRUE)
mesh_1km(x, strict = TRUE)
mesh_500m(x, strict = TRUE)
mesh_250m(x, strict = TRUE)
mesh_125m(x, strict = TRUE)
mesh_100m(x, strict = TRUE)
mesh_auto(x, strict = TRUE)
is_mesh(x)
```

Arguments

- `x` A list or vector.
`strict` A logical scalar. Should the number of digits in the mesh code match a given number of digits?

Value

A `mesh` class vector.

Examples

```
mesh_80km("53394526313")
mesh_80km("53394526313", strict = FALSE)

mesh_auto(c("53394526313", "5339358633", "533945764"))
mesh_auto(c("53394526313", "5339358633", "533945764"), strict = FALSE)
```

`mesh_distance`

Distance between regional meshes

Description

If `mesh` and `mesh_to` are both vectors, the distance between `mesh` and `mesh_to` is calculated. If `mesh` is a list, The path distance of each element is calculated.

Usage

```
mesh_distance(mesh, mesh_to, close = FALSE, type = "keep_na")
```

Arguments

- `mesh` A `mesh` vector or a list of `mesh` vector.
`mesh_to` A `mesh` vector.
`close` Should the path of each element be closed when `mesh` is a list?
`type` How is the NA mesh treated when `mesh` is a list? "`skip_na`" skips the NA mesh and connects the paths. "`keep_na`" by default.

Value

A double vector.

`mesh_grid`*Create regional mesh grids***Description**

Create regional mesh grids

Usage

```
mesh_grid(X_min, Y_min, X_max, Y_max, size)
```

Arguments

<code>X_min</code>	A numeric vector.
<code>Y_min</code>	A numeric vector.
<code>X_max</code>	A numeric vector.
<code>Y_max</code>	A numeric vector.
<code>size</code>	A mesh size.

Value

A list of `mesh` vectors.

`mesh_line`*Draw line segments between regional meshes***Description**

If `mesh` and `mesh_to` are both vectors, the line between `mesh` and `mesh_to` is drawn (using Bre-senham's line algorithm). If `mesh` is a list, The path lines for each element in the mesh will be drawn.

Usage

```
mesh_line(mesh, mesh_to, close = FALSE, skip_na = FALSE)
```

Arguments

<code>mesh</code>	A <code>mesh</code> vector or a list of <code>mesh</code> vector.
<code>mesh_to</code>	A <code>mesh</code> vector.
<code>close</code>	Should the path of each element be closed when <code>mesh</code> is a list?
<code>skip_na</code>	Should skip the NA mesh and connects the paths? <code>FALSE</code> by default.

Value

A list of `mesh` class vectors.

mesh_move

Moving on regional meshes

Description

Moving on regional meshes

Usage

```
mesh_move(mesh, n_X, n_Y)
```

Arguments

mesh	A mesh vector.
n_X	Number of moving cells in the longitude direction.
n_Y	Number of moving cells in the latitude direction.

Value

A mesh class vector.

mesh_neighbor

Neighborhood regional mesh

Description

Neighborhood regional mesh

Usage

```
mesh_neighbor(mesh, n = 1L, moore = TRUE, simplify = TRUE)
```

Arguments

mesh	A mesh vector.
n	A numeric vector of degrees.
moore	Moore neighborhood (TRUE) or Von Neumann neighborhood (FALSE).
simplify	Should simplify the format of the return?

Value

A list of mesh class vectors.

mesh_subdivide	<i>Subdivide regional meshes</i>
----------------	----------------------------------

Description

`mesh_subdivide` makes the regional meshes finer.

Usage

```
mesh_subdivide(mesh, size)
```

Arguments

mesh	A mesh vector.
size	A mesh size.

Value

A list of `mesh` class vector.

mesh_to_geometry	<i>Converting regional meshes to sfc geometries</i>
------------------	---

Description

Converting regional meshes to sfc geometries

Usage

```
mesh_to_polygon(mesh, crs = sf::NA_crs_)

mesh_to_point(mesh, crs = sf::NA_crs_)
```

Arguments

mesh	A mesh vector.
crs	Coordinate reference system.

Value

`mesh_to_polygon` returns a `sfc_POLYGON` vector. `mesh_to_point` returns a `sfc_POINT` vector.

mesh_zoomin	<i>Zoom-in regional meshes</i>
-------------	--------------------------------

Description

[Deprecated] `mesh_zoomin` makes the regional meshes finer.

Usage

```
mesh_zoomin(mesh, size)
```

Arguments

mesh	A mesh vector.
size	A mesh size.

Value

A list of `mesh` class vector.

mesh_zoomout	<i>Zoom-out regional meshes</i>
--------------	---------------------------------

Description

[Deprecated] `mesh_zoomout` makes the regional meshes coarser.

Usage

```
mesh_zoomout(mesh, size)
```

Arguments

mesh	A mesh vector.
size	A mesh size.

Value

A `mesh` class vector.

<code>point_to_mesh</code>	<i>Converting sfc points to regional meshes</i>
----------------------------	---

Description

Converting sfc points to regional meshes

Usage

```
point_to_mesh(point, size)
```

Arguments

<code>point</code>	A <code>sfc_POINT</code> vector.
<code>size</code>	A mesh size.

Value

A `mesh` class vector.

<code>XY</code>	<i>Conversion between mesh and coordinates (longitude and latitude)</i>
-----------------	---

Description

Conversion between mesh and coordinates (longitude and latitude)

Usage

```
XY_to_mesh(X, Y, size)
mesh_to_XY(mesh, center = TRUE)
```

Arguments

<code>X</code>	A numeric vector of longitude.
<code>Y</code>	A numeric vector of latitude.
<code>size</code>	A mesh size.
<code>mesh</code>	A <code>mesh</code> class vector.
<code>center</code>	Should the center point of the mesh be returned? Otherwise the end points will be returned. <code>TRUE</code> by default.

Value

`XY_to_mesh` returns a `mesh` class vector.

`mesh_to_XY` returns a `tbl_df`.
