Package 'ljr'

May 1, 2016

Version 1.4-0

Date 2016-4-30

Title Logistic Joinpoint Regression

Author Michal Czajkowski, Ryan Gill, Greg Rempala

Maintainer Ryan Gill <ryan.gill@louisville.edu>

Description Fits and tests logistic joinpoint models.

---

kcm   *Kentucky yearly cancer mortality from 1999-2005.*

Description

This table gives the yearly mortality counts due to neoplasms (ICD 10 codes C00-D48) and population sizes for Kentucky from 1999-2005. For more information, see http://wonder.cdc.gov/wonder/help/cmf.html.

Usage

```
data(kcm)
```

Format

A 7 by 3 data frame.

Source

Centers for Disease Control and Prevention, National Center for Health Statistics. Compressed Mortality File 1999-2005. CDC WONDER On-line Database, compiled from Compressed Mortality File 1999-2005 Series 20 No. 2K, 2008. Accessed at http://wonder.cdc.gov/cmf-icd10.html on May 5, 2008.

---

ljr0   *MLE with 0 joinpoints*

Description

Determines the maximum likelihood estimate of model coefficients in the logistic joinpoint regression model with no joinpoints.

Usage

```
ljr0(y,n,tm,X,ofst)
```

Arguments

y	the vector of Binomial responses.
n	the vector of sizes for the Binomial random variables.
tm	the vector of observation times.
X	a design matrix containing other covariates.
ofst	a vector of known offsets for the logit of the response.

Details

The re-weighted log-likelihood is the log-likelihood divided by the largest component of n.

Value

Coef   A table of coefficient estimates.

wlik   The maximum value of the re-weighted log-likelihood.

Author(s)

The authors are Michal Czajkowski, Ryan Gill, and Greg Rempala. The software is maintained by Ryan Gill <rsgill01@louisville.edu>.

Examples

```
data(kcm)
attach(kcm)
ljr0(Count,Population,Year+.5)
```

---

ljr01   *Perform test of 0 vs 1 joinpoints.*

Description

This function tests the null hypothesis of 0 joinpoints versus the alternative of one joinpoint based on the likelihood ratio test statistic. The p-value is determined by a Monte Carlo method.

Usage

```
ljr01(y,n,tm,X,ofst,R=1000,alpha=.05)
```

Arguments

y	the vector of Binomial responses.
n	the vector of sizes for the Binomial random variables.
tm	the vector of ordered observation times.
X	a design matrix containing other covariates.
ofst	a vector of known offsets for the logit of the response.
R	number of Monte Carlo simulations.
alpha	significance level of the test.

Details

The re-weighted log-likelihood is the log-likelihood divided by the largest component of n.

Value

pval	The estimate of the p-value via simulation.
Coef	A table of coefficient estimates.
Joinpoint	The estimates of the joinpoint, if it is significant.
wlik	The maximum value of the re-weighted log-likelihood.

Author(s)

The authors are Michal Czajkowski, Ryan Gill, and Greg Rempala. The software is maintained by Ryan Gill <rsgill01@louisville.edu>.

## Not run: ljr01(Count,Population,Year+.5,R=20)
```

---

ljr1 *MLE with 1 joinpoint*

Description

Determines the maximum likelihood estimates of model coefficients in the logistic joinpoint regression model with one joinpoint.

Usage

```
ljr1(y,n,tm,X,ofst,summ=TRUE)
```

Arguments

y	the vector of Binomial responses.
n	the vector of sizes for the Binomial random variables.
tm	the vector of ordered observation times.
X	a design matrix containing other covariates.
ofst	a vector of known offsets for the logit of the response.
summ	a boolean indicator of whether summary tables should be returned.

Details

The re-weighted log-likelihood is the log-likelihood divided by the largest component of n.

Value

Coef	A table of coefficient estimates.
Joinpoint	The estimate of the joinpoint.
wlik	The maximum value of the re-weighted log-likelihood.

Author(s)

The authors are Michal Czajkowski, Ryan Gill, and Greg Rempala. The software is maintained by Ryan Gill <rsgill01@louisville.edu>.

attach(kcm)
ljr1(Count,Population,Year+.5)
```

---

ljr11   *Test coefficients conditioned on K=1 joinpoint.*

Description

This function performs the likelihood ratio tests to find p-values in testing the significance of each of the coefficients as well as the intercept and ordered observation times. The p-values are determined by a Monte Carlo method.

Usage

```
ljr11(y,n,tm,X,ofst,R=1000)
```

Arguments

y	the vector of Binomial responses.
n	the vector of sizes for the Binomial random variables.
tm	the vector of ordered observation times.
X	a design matrix containing other covariates.
ofst	a vector of known offsets for the logit of the response.
R	number of Monte Carlo simulations.

Details

The re-weighted log-likelihood is the log-likelihood divided by the largest component of n.

Value

pvals	The estimates of the p-values via simulation.

Author(s)

The authors are Michal Czajkowski, Ryan Gill, and Greg Rempala. The software is maintained by Ryan Gill <rsgill01@louisville.edu>.

```

---

ljrb	*Perform backward joinpoint selection algorithm with upper bound K.*

Description

This function performs the backward joinpoint selection algorithm with K maximum possible number of joinpoints based on the likelihood ratio test statistic. The p-value is determined by a Monte Carlo method.

Usage

```
ljrb(K,y,n,tm,X,ofst,R=1000,alpha=.05)
```

Arguments

K	the pre-specified maximum possible number of joinpoints
y	the vector of Binomial responses.
n	the vector of sizes for the Binomial random variables.
tm	the vector of ordered observation times.
X	a design matrix containing other covariates.
ofst	a vector of known offsets for the logit of the response.
R	number of Monte Carlo simulations.
alpha	significance level of the test.

Details

The re-weighted log-likelihood is the log-likelihood divided by the largest component of n.

Value

pvals	The estimates of the p-values via simulation.
Coef	A table of coefficient estimates.
Joinpoints	The estimates of the joinpoint, if it is significant.
wlik	The maximum value of the re-weighted log-likelihood.

Author(s)

```

---

ljrf	*Perform forward joinpoint selection algorithm with unlimited upper bound.*

Description

This function performs the full forward joinpoint selection algorithm based on the likelihood ratio test statistic. The p-value is determined by a Monte Carlo method.

Usage

```
ljrf(y,n,tm,X,ofst,R=1000,alpha=.05)
```

Arguments

y	the vector of Binomial responses.
n	the vector of sizes for the Binomial random variables.
tm	the vector of ordered observation times.
X	a design matrix containing other covariates.
ofst	a vector of known offsets for the logit of the response.
R	number of Monte Carlo simulations.
alpha	significance level of the test.

Details

The re-weighted log-likelihood is the log-likelihood divided by the largest component of n.

Value

pvals	The estimates of the p-values via simulation.
Coef	A table of coefficient estimates.
Joinpoints	The estimates of the joinpoint, if it is significant.
wlik	The maximum value of the re-weighted log-likelihood.

ljrjk	*Perform test of j vs k joinpoints.*

Description

This function tests the null hypothesis of j joinpoint(s) versus the alternative of k joinpoint(s) based on the likelihood ratio test statistic. The p-value is determined by a Monte Carlo method.

Usage

```
ljrjk(j,k,y,n,tm,X,ofst,R=1000,alpha=.05)
```

Arguments

j,k	pre-specified number of joinpoints in the null and alternative hpyotheses (the smaller is used for the null).
y	the vector of Binomial responses.
n	the vector of sizes for the Binomial random variables.
tm	the vector of ordered observation times.

X	a design matrix containing other covariates.
ofst	a vector of known offsets for the logit of the response.
R	number of Monte Carlo simulations.
alpha	significance level of the test.

Details

The re-weighted log-likelihood is the log-likelihood divided by the largest component of n.

Value

pval	The estimate of the p-value via simulation.
Coef	A table of coefficient estimates.
Joinpoint	The estimates of the joinpoint, if it is significant.
wlik	The maximum value of the re-weighted log-likelihood.

Author(s)

The authors are Michal Czajkowski, Ryan Gill, and Greg Rempala. The software is maintained by Ryan Gill <rsgill01@louisville.edu>.

ljrk *MLE with k joinpoints*

Description

Determines the maximum likelihood estimates of model coefficients in the logistic joinpoint regression model with k joinpoints.

Usage

```
ljrk(k,y,n,tm,X,ofst)
```

Arguments

k	the pre-specified number of joinpoints (with unknown locations).
y	the vector of Binomial responses.
n	the vector of sizes for the Binomial random variables.
tm	the vector of ordered observation times.
X	a design matrix containing other covariates.
ofst	a vector of known offsets for the logit of the response.

Details

The re-weighted log-likelihood is the log-likelihood divided by the largest component of n.

Value

Coef	A table of coefficient estimates.
Joinpoints	The estimates of the joinpoints.
wlik	The maximum value of the re-weighted log-likelihood.
